

GigaTrust—Ensuring Secure Endpoint Content Collaboration in the Cloud

Our vision is to protect content from unauthorized use—no matter where or how it travels.

Who we are

GigaTrust™ is a leading provider of endpoint security and document in-use protection for Android, iOS and Windows devices, offering fully managed SaaS solutions hosted in Microsoft Azure, as well as on-premise private cloud service, such as Azure Stack and Hyper-V, and hybrid cloud installations. The company's flagship offering, GigaCloud™, delivers secure email and document collaboration services anytime, anywhere, on virtually any mobile or desktop device and any platform with real-time data analytics, reporting and administrative tools.

What makes us different

GigaCloud is the first and only secure email and document protection, consumption, and collaboration service that is an easy-to-use, easy-to-deploy cloud service powered by the Microsoft—Active Directory Rights Management Services (AD RMS) security ecosystem. A soon-to-be-released Linux OS interface will deliver scalability and broad device support to open, view and persistently protect documents at all times no matter where they are stored, allowing for easy integration with CASBs and providing more comprehensive threat protection, data security, and compliant solutions by including in-use protection directly on mobile devices and PCs.

Why you need us

- Document/file sharing and collaboration combined with enterprise security and control protects information against breaches, non-compliance, hacks and intellectual property theft from any mobile or desktop device.
- In-use protection secures documents created and consumed outside the firewall including users of public clouds and the prevalent new normal of Bring Your Own Device environments in offices and everywhere.
- Built-in persistent protection in the cloud helps subscribers avoid the burden of setting up this costly infrastructure and the complexity of managing it—and provides the ability to enroll online, reducing the time and capital requirements of traditional deployments, with service available immediately to all users.
- All configurations easily integrate and provision any external customers or partners the enterprise wants to enable in the secure and trusted collaborative environment.
- Securely and persistently manages content inside and outside the enterprise supporting corporate governance and compliance.

What we offer

GigaCloud delivers optimum document protection by providing secure collaboration through a private key subscribers hold, delivering full control on who can print, forward or edit information. It applies and enforces security permissions (or rights) down to the digital content (emails, documents, pictures), level resulting in content being protected from misuse while at rest, in transit, and most important, in use—even when opened by any permitted recipient—on any Android and iOS mobile device or Windows PC, and is always synchronized. It meets enterprise document security requirements for external cloud-based file sync and sharing integration services including Dropbox,

OneDrive and Google Drive and secure document management systems such as SharePoint®.

GigaCloud's Data OverWatch provides measurement, auditing, tracking and analytics of data content. The analytics show ROI and user adoption and enables customers to better manage people, devices, content and policy. It allows users to know what is protected and where that content resides, and all the retained information is configurable and location sensitive. Events are captured from applications interacting with the secure content and extensive analytics data is captured for each event. Data OverWatch events provide information about user, device, content and policy.

Who we serve

GigaTrust solves the challenges of content protection and security in both the public and private sectors. With over 13 years of experience understanding the need for privacy, compliance, security and governance, GigaTrust focuses on serving Fortune 2000 companies and government agencies. Our clients depend on us to ensure their emails and documents are persistently protected within and outside the enterprise—at rest... in transit...and in use, on any device, on any platform, sent to anyone.

About GigaTrust

GigaTrust is a leading provider of endpoint security and document in-use protection for Windows, iOS and Android devices, offering fully managed SaaS solutions hosted in Microsoft Azure, as well as on-premises and hybrid cloud installations. GigaTrust is the largest and oldest provider that enhances and extends Microsoft's Rights Management Services (RMS) content security solution. Customers rely on GigaTrust's innovative next-generation content security technologies, combined with ease of use and deployment, to enable intellectual property protection and confidentiality.

The company's flagship offering, GigaCloud™, delivers secure email and document collaboration services anytime, anywhere, on virtually any device and any platform with real-time data analytics, reporting and administrative tools. It applies and enforces security permissions down to the digital content level, protecting content from misuse throughout the entire lifecycle—while in transit, at rest and, most importantly “in use,” even when opened by any permitted recipient. GigaCloud is available in a secure private cloud configuration for enterprises and government entities requiring added security features and administrative control.
