GigaTrust
Intelligent Rights Management™

GigaTrust RMS QuickStart Program

You may have RMS but it's not deployed or perhaps you're still thinking about using Microsoft's RMS to protect your valuable intellectual property and sensitive information. Either way, GigaTrust can help you get the system up and operating rapidly and efficiently.

GigaTrust can help you hit the ground running!

Microsoft RMS + GigaTrust = Total security for all your digital intellectual property

GigaTrust is an industry leader in providing Enterprise Rights Management software that delivers persistent content protection and authentication services to both large commercial and government enterprises as well as small-to-medium business (SMB) markets. Persistent content protection represents a major advance in security, as it allows businesses to establish and enforce secure corporate policies to protect everyday content, collaboration and sharing of any document across the Internet—within as well as between enterprises.

We're the only provider of Intelligent Rights Management—an innovative, next-generation content security approach built on the foundation of Microsoft's Rights Management Services (RMS). Intelligent Rights Management represents a major breakthrough for the Enterprise Rights Management (ERM) industry.

GigaTrust's new QuickStart program is designed to get your department or organization up and running quickly, easily and correctly, with Rights Management Services (RMS) from Microsoft®. The program provides all the key elements necessary for getting started with RMS and in securing the integrity of your confidential data. The QuickStart program serves as the foundation for an easy migration to an enterprise-wide deployment when ready.

What is RMS?

RMS from Microsoft is a security technology that works with RMS-enabled applications to help safeguard digital content and email from unauthorized use—whether on a server, in an email, or even on a flash drive—unintentionally left behind in an airport or public computer. RMS augments an organization's security strategy by protecting information through persistent usage policies, which remain with the information, no matter where it goes. Organizations can use RMS to assign a series of permissions to help prevent sensitive information—such as confidential Outlook emails or documents (i.e., financial reports, product specifications, customer data, etc.)—from intentionally or accidentally getting into the wrong hands. Thus, you can control and restrict how the content is used and who may read it, and what they can do with it.

GigaTrust has been working with RMS since its release in 2003, with proven, extensive experience in planning and deploying RMS in large and small companies and across financial, manufacturing, healthcare and government organizations. We can help you leverage RMS to ensure secure collaboration across your enterprise and out to your supply chain and business partner network.

The QuickStart Program

GigaTrust is now offering a service bundle designed to get RMS deployed and in use in your organization quickly and inexpensively. Implementation of the QuickStart program includes:

- **Pre-Planning Conference Call**—Discussion of basic system design to meet short-term goals of RMS adoption as well as requirements software and hardware requirements for deployment.

- **Day One On-site Consultation**—Discussion and identification of the elements of architectural design the customer should consider, along with best practices in deployment and user provisioning, policy development and implementation considerations.

- **Days Two and Three On-site**—RMS server deployment and configuration. In addition, GigaTrust assists the customer with creation of a user provisioning

Protect your digital content today with proven RMS technology built into the Microsoft Server platform.
